

# PINEHURST

## Creeping Bentgrass

### ATTRIBUTES

**Pinehurst (Alpha)** is the first of a new generation of creeping bentgrass, with qualities never before seen in golf turf:

- “Championship greens without the championship maintenance”
- Ball marks, divots heal rapidly
- Unparalleled ground coverage and density
- Dollar spot resistance equal to the best
- Rich green color
- Makes visible gains on *Poa annua* each year
- Great for GREENS, TEES and FAIRWAYS!

### PERFORMANCE HIGHLIGHTS

**“The Fore!giving Bentgrass”** – The single biggest factor that sets **Pinehurst** apart is ground coverage. **Pinehurst** retains ground coverage under some incredibly tough growing conditions. With its exceptional shoot density, **Pinehurst** sets a new standard for putting green turf: truer putting, more fullness, and a more visually appealing surface. Yet it is remarkably easy to maintain earning it the “Fore!giving Bent” title for excelling even when climate or cultural practices may not be ideal.

**Aggressive against Poa** – At Jacklin Seed, we test every single bent strain in our breeding program against *Poa annua*. If it can’t hold up against *Poa*, we pitch it. All of the plants that went into **Pinehurst** excelled at keeping *Poa* at bay. In fact, they made visible gains against *Poa* every year.

**Optimized for the mid-budget golf course** – Unlike some earlier bents, **Pinehurst** was bred and optimized with the mid-budget golf course in mind. **Pinehurst** provides tournament-quality golf for every golf course.

#### **TESTIMONIAL: Sand Ridge CC, Chardon, OH**

*“We had cottage guests at the course who took quite a few wedge shots off our bent test plots, leaving big divots all across the plots. Four weeks later, I was showing a visitor around. The divots were still apparent on the A’s and L-93 but they were gone on the Alpha (Pinehurst) plots. I mean, we could still feel the depressions in the Alpha (Pinehurst) plots but the divots were filled solid.”*
