

Micronutrients are an essential part of growing quality, high yielding crops. Che brand micronutrients are EDTA chelated to improve availability when soil applied. Che brands are formulated to mix with starter fertilizer blends without tying up in the spray tank or the soil. The Che formulation allows for maximum availability to the growing crop when soil applied. Micronutrients are best utilized when spoon fed to the crop throughout the growing season and the Che brand is built to improve uptake when soil applied.

## CROP/RATES

Refer to the appropriate Che micronutrient label for the desired rate by crop.

## APPLICATION TIMING

Refer to the appropriate Che micronutrient label for correct application timings.
